

H6 is exploratory and NOT preregistered (H6_README).
H6 README records input MD5 13ffdfbd… (D: path), not
the current d1566f… file; the H6.1 estimates in a were
re-derived from the current file and match exactly.
H6 uses outcomes on the raw scale (no ln transform).
Filled symbols: BH q < 0.05 within each H6 family.

d: dot = BH q < 0.05; × = not fitted (insufficient data: env atmo_pm1_avg and lys_medi_avg composites are empty).
BH family = all 1378 fitted pairs of the 55 composites (403 q < 0.05), which includes 4 trivial r = 1 pairs (LF nu vs HF nu; dBA, PM2.5 and speed vs their single-member groups) that are not shown. H9 applies ln to participant × phase means (H1–H4 average ln over 10 s epochs).
